

1.1 Problem Statement

Problem Statement

Records in a ServiceNow table often contain data that only a specific group of users should view. Role-based ACLs cannot compare a field value on a record with the attributes of the logged-in user, so users may see records that do not belong to their branch.

Problem Statement Template

Item	Description
I am	A ServiceNow administrator managing student records
I am trying to	Allow only EEE branch users to view EEE records
But	Role-based ACLs cannot check a record's Branch field value
Because	Roles grant access to the whole table, not to individual records
Which makes me feel	Concerned about unauthorised data exposure

Impact

- Sensitive branch-specific data is visible to unrelated users.
- Manual checks are error-prone and cannot be enforced by the platform.
