

## 1.3 Brainstorm and Idea Prioritization

### Ideas Generated

| Idea                                          | Impact | Effort | Priority |
|-----------------------------------------------|--------|--------|----------|
| Create separate tables for each branch        | Medium | High   | Low      |
| Use role-based ACL only                       | Low    | Low    | Low      |
| Use a script-controlled ACL on a single table | High   | Low    | High     |
| Use a Business Rule to filter records         | Medium | Medium | Medium   |

### Selected Idea

A script-controlled ACL on a single table is selected because it enforces record-level security directly at the platform level with minimal development effort.
