

5.3 Script-Controlled ACL Development

Navigate to System Security > Access Control (ACL), create a new record ACL with Operation = read on the custom table, and enter the following in the Advanced script field.

```
(function() {  
    var allowed = false;                // deny by default  
    if (current.u_branch == 'EEE') {  
        // EEE records: only members of the EEE Branch group  
        allowed = gs.getUser().isMemberOf('EEE Branch');  
    } else {  
        allowed = true;                // other records: normal access  
    }  
    return allowed;  
})();
```
